

Second Shift

Turns two weeks of exhaustion into one page of evidence.

WHAT IT IS

A **voice-first AI agent for unpaid family carers of people with dementia**. Speak naturally at home. It logs care events, spots missed-medicine and symptom patterns, and auto-generates an **evidence-cited GP / memory-clinic brief**.

THE USER

Ravi, 34, works night shifts and cares for his 71-year-old father, who has dementia and takes 6 medicines. He is untrained, exhausted, and the only person who knows what happened at home this week. At the GP appointment, he forgets half of it.

WHY IT MATTERS

- ~982,000 people with dementia in the UK
- Unpaid care is 50% of dementia’s £42bn cost
- A third of dementia carers give 100+ hours a week
- Home observations rarely reach the GP

HOW IT WORKS

The carer speaks → speech-to-text → AI extracts structured events → a rules engine flags patterns → one tap produces a cited PDF for the GP or memory clinic.

WHAT’S NOVEL

No UK product found that connects **what the dementia carer observes at home** to **what the GP reads before the appointment**.

PRODUCT	COVERS	MISSING VS. SECOND SHIFT
Jointly (Carers UK)	Circle of care, tasks, medicine lists	Tap-based; no voice logging, patterns, or GP brief
Share2Care (NHS WY)	Carer app, meds, contingency plan in NHS record	Organisation tool, not voice → patterns → GP brief
Heidi / Tortus / Accurx	AI scribe of the GP appointment	Knows nothing about what happened at home
Curendi (NHS CEP)	Dementia carer guidance between appointments	Advice and diaries, not voice → patterns → GP brief

Four novelty points

- Home → GP closed loop
- Voice-first for the carer, not the patient
- Evidence-cited briefs (every line traces to a voice log)
- Family handover briefs (“your sister takes over tomorrow”)

Safety stance

Organises notes and drafts questions for the GP. Never diagnoses, triages, or gives treatment advice. Not a medical device.

THE 30-SECOND DEMO

11pm. Ravi says: *“Gave dad his 8pm meds, 40 minutes late. More confused again this evening, third time this week.”* The agent logs it, flags the pattern after Tuesday’s dose change, and generates a one-page brief with timestamps, symptoms, and 5 questions for the GP.

Ravi walks into the appointment with evidence instead of exhaustion.

Beachhead: dementia at home. Later: stroke, Parkinson’s, frailty. Synthetic demo data. Not a medical device.
